Derivatives

A derivative function gives the instantaneous slope at each input. Differentiate sums term by term, keep constant factors, and use $d(x^n)/dx = nx^{n-1}$ for positive integers n .

$$\frac{d}{dx}x^2 = 2x$$

Try it

Differentiate $x^3 + 4x$.

Integrals

An indefinite integral reverses differentiation and includes an unknown constant.

$$\int 2x \, dx = x^2 + C$$

Try it

Find the general antiderivative of $3x^2$.
